

Second Company

So how we work in practice?

Second Company provides companies in the West with crucial competitive power. Instead of an expensive millstone round your neck, IT becomes a source of potential competitive advantage. How do we do this? We're good at coming up with creative ideas and we work with programmers in China because they develop our ideas fast and work effectively within tight-knit dedicated teams.

We use advanced methods based on empowerment to maximise the benefit from the skill, experience and competences of our developers. High frequency feedback leads to fast development and high levels of transparency. Before we start the whole team knows not only *what* has to be done but also *why*.

You work with Dutch project leaders and Chinese developers as if they were part of your own IT department. This how we're able to rapidly build effective software, making use of a proven 3-stage approach.

- **Envisage**
 - Based on a quick scan we produce an outline, which describes your domain and defines your goals
 - Architecture: we design the software infrastructure that best fits your business.
- **Design**
 - We test the infrastructure
 - We produce a prototype: our initial proposal with clickable screens
 - We test the software
 - We design a working user interface.
- **Deliver**
 - We request formal acceptance of the prototype
 - We develop a final version
 - We deliver a functioning system and, where required, provide after-sales service.
